Slide 01 · Project Pitch | 0:00–0:05

Hello everyone. Today, we’re presenting our social assistance visualization project.

Slide 02 · Group Name | 0:05–0:07

We’re Newtown’s group.

Slide 03 · Project Question | 0:07–0:21

We ask how social assistance in Ontario has changed over time, focusing on family composition and regional differences. Our project will present these patterns through an interactive website.

Slide 04 · Target Audience | 0:21–0:41

Our primary audience is social assistance policy analysts at Ontario’s Ministry of Children, Community and Social Services. They can use our website to understand trends, compare regions, and identify patterns for further investigation when preparing policy briefings.

Slide 05 · Dataset | 0:41–1:06

We use the course-provided Ontario Works, or OW, and Ontario Disability Support Program, or ODSP, case-characteristics files. These contain quarterly observations from March 2003 to March 2026, covering Ontario and fifteen census metropolitan areas, or CMAs. We examine case counts, family-type shares, and Ontario Works assistance-duration categories.

Slide 06 · Question 1 | 1:06–1:23

First, how did OW and ODSP caseload trends differ before, during, and after COVID-19? Focusing on 2017 to 2025, users will select time ranges and compare the programs through an interactive line chart.

Pitch presentation script

Slides 7–12 · Continue from Question 1

Slide 07 · Why Question 1 Matters | 1:23–1:34

This provides province-wide context and helps analysts identify periods when the programs' trends diverged, without attributing those changes solely to COVID-19.

Slide 08 · Question 2 | 1:34–1:53

Second, how have single-person-without-children case shares changed across CMAs, and how has the gap between OW and ODSP changed? Each share divides single-person cases by total cases for the same program, CMA, and quarter.

Slide 09 · Why Question 2 Matters | 1:53–2:10

Users will compare two quarters, rank regions by gap changes, and select a CMA to inspect its trends. This highlights where gaps narrowed, widened, or remained large, guiding further investigation.

Slide 10 · Question 3 | 2:10–2:29

Third, how has the duration composition of OW cases changed, and which regions have higher long-term shares? Long-term means nineteen or more consecutive months. Users will compare duration categories across regions and time.

Slide 11 · Why Question 3 Matters | 2:29–2:44

This helps analysts locate higher or increasing long-term shares and prioritize follow-up research, including employment-support needs. These aggregate data do not track individual outcomes or establish policy effectiveness.

Slide 12 · Thank You | 2:44–2:52

Together, our three views provide a clearer picture of Ontario's social assistance caseloads. Thank you.
